

ORAL SURGERY INFORMED CONSENT

Patient Name:
Last First MI Preferred Name

Teeth:

I understand that oral surgery and/or dental extractions include inherent risks such as, but not limited to the following:

1. Injury to the nerves: This would include injuries causing numbness of the lips, the tongue; any tissues of the mouth, and/or cheeks or face. This numbness which could occur may be of a temporary nature, lasting a few days, a few weeks, a few months or could possibly be permanent, and could be the result of surgical procedures or anesthetic administration.
2. Bleeding, bruising, swelling: Bleeding may last several hours. If profuse you must contact us as soon as possible. Some swelling is normal, but if severe, you should notify us. Bruises or hematomas may persist for some time.
3. Dry socket: This occurs on occasion when teeth are extracted and is a result of a blood clot not forming properly during the healing process. Dry sockets can be extremely painful if not treated.
4. Sinus involvement: In some cases, the root tips of upper teeth lie in close proximity to the sinuses. Occasionally during the extraction or surgical procedures, the sinus membrane may be perforated. Should this occur, it may be necessary to have the sinus surgically closed. Root tips may need to be retrieved from the sinus.
5. Infection: No matter how carefully surgical sterility is maintained, it is possible, because of the existing non-sterile or infected oral environment, for infection to occur post-operatively. At times, these may be of a serious nature. Should severe swelling occur particularly accompanied with fever or malaise, attention should be received as soon as possible.
6. Fractured jaw, roots, bone fragments, or instruments: Although extreme care will be used, the jaw, teeth roots, bone spicules, or instruments used in the extraction procedure may fracture or be fractured requiring retrieval and possibly referral to a specialist. A decision may be made to leave a small piece of root, bone fragment or instrument in the jaw when removal may require additional extensive surgery, which could cause more harm and add to the risk of complications.
7. Injury to adjacent teeth or fillings: This could occur at times no matter how carefully surgical and/or extraction procedures are performed.
8. Bacterial Endocarditis: Because of the normal existence of bacteria in the oral cavity, the tissues of the heart as a result of reasons known or unknown, may be susceptible to bacterial infection transmitted through blood vessels, and bacterial endocarditis (an infection of the heart) could occur. It is my responsibility to inform the dentist of any heart problems known or suspected.
9. Unusual reactions to medications given or prescribed: Reactions, either mild or severe, may occur from anesthetics or other medications administered or prescribed. Cardiac arrest could occur as a reaction to local anesthetic solution if you have used cocaine or methamphetamines within the last 24-48 hours. All prescription drugs must be taken according to instructions. Women using oral contraceptives must be aware that antibiotics can render these contraceptives ineffective. Other methods of contraception must be utilized during the treatment period.

10. Osteonecrosis of the Jaw: Bisphosphonates, (ie.. Zometa, Aredia, Fosamax, Actonel), considered standard of care treatment when used in conjunction with antineoplastic chemotherapeutic agents to reduce bone pain, hypercalcemia, and skeletal complications in patient with advanced breast cancer, multiple myeloma, and more recently osteoporosis, may contribute to a rare condition known as osteonecrosis of the jaw (ONJ). ONJ is an uncommon clinical scenario characterized as a nonhealing extraction socket or exposed, necrotic jawbone with localized swelling and discharge. I will inform the dentist if I have ever used bisphosphonates to treat cancer or osteoarthritis.

11. It is my responsibility to seek attention should any undue circumstances occur post-operatively and I shall diligently follow any pre-operative and post-operative instructions given to me.

Informed Consent: I have been given the opportunity to ask any question regarding the nature and purpose of surgical treatment and/or extraction of teeth and have received answers to my satisfaction. I do voluntarily assume any and all possible risks, results, which may or may not be achieved. No guarantees or promises have been made to me concerning my recovery and results of the treatment to be rendered to me. The fee(s) for this service have been explained to me and are satisfactory. By signing this form, I am freely giving my consent to allow and authorize Dr. W. Todd Rogers and his associates to render any treatment necessary or advisable to my dental conditions, including any and all anesthetics and/or medications,

I have read the above conditions of treatment and agree to the content.
